on Aug 31, 2001 this sequence version replaced ji:14161146.
During sequence assembly data is compared from overlapping clones. Where differences are found these are amoutated as variations rogether with a note of the overlapping clone, as variations annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were eighter double-stranded or sequencily with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were orgered by the pastriction digest. The following abbreviations are used to associate primary accession numbers aiven in the feature table with their source databases: Em. EMBL. Swire such database can be found a Wir, WORMPEP; Informati'n on the WORMPEP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          * NOTE: This record contains 84 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be generich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1547 2238 contig of 692 bp in length 1547 2238 contig of 692 bp in length 100 bp 233 3017: contig of 679 bp in length 3018 3117: gap of 100 bp 3118 3129; app of 100 bp 3198 399 3898: contig of 681 bp in length 3799 3898: contig of 681 bp in length 3789 3898: contig of 681 bp in length 3789

NOTE: This is a 'working draft' sequence. It currently consists of 35 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be
                                                                                                                                                              web site: http://hpp.gsc.riken.go.jp/

Center project information
Center clone name: Humbraftl1
Center clone name: RP11-750P5
Center clone name: RP11-750P5
Sequencing vector: PCR products: 100% of reads
Chemistry: Dye-terminator ET-amersham; 100% of reads
Assembly program: Phrapy version 0.990129
Consensus quality: 149299 bases at least Q40
Consensus quality: 167078 bases at least Q30
Consensus quality: 167078 bases at least Q20
Insert size: 169959; sum-of-contigs
Quality coverage: 4.01x in Q20 bases; sum-of-contigs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           * NOTE: This is a 'working draft' sequence. It currently NOTE: This is a working draft' sequence. It currently is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 14 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gars are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Center project name: L10752

                                                                                                                                                                                                                                                                                                                      Mclaren, S.

Direct Submission

Submitted (09-DEC-1999) Sanger Centre, Hinxton, Cambridgeshire,

CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk

on Feb 5, 1998 this sequence version replaced gi:2578126.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.

This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not neressarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Direct Submission

Submitted (21-Aug-2000) Sanger Centre, Hinxton, Cambridgeshire,

CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone

requests: clonereques/fsanger.ac.uk

CD Jul 23, 2000 this sequence version replaced qi:9367364.

CD Jul 23, 2000 this sequence version replaced qi:9367364.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                      ALLISSSI 175940 bp DNA linear PRI 21-AUG-2000 Human DNA sequence from clone RPI1-57G10 on chromosome 10 Contains a J-domain containing protein (JDP1) isoform B, the SIRTI gene (Sir2-like proteins (siruitins) type 1), part of a novel gene similar to KIAA0032, two ribosomal pseudogenes, 2 CpG islands, ALLISSS and GSSs, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green. numbublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and CDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SISs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and

NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Pools of cells ware isolated from a GenomeScreen(TM) library. The
Pools of cells was generated by retroviral integration of a gene
11brary of cells was generated by retroviral integration of a gene
11brary of cells was generated by retroviral integration of a gene
12prary of cells was generated by retroviral integration of a gene
12prary of cells was generated by retroviral integration of a gene
12prary of cells was generated by retroviral integration of a gene
12prary of cells was generated by retroviral integration of a gene
12prary of cells was generated by a splice
12prary of cells was retroviral for gene was
12prary of cells was from isolated pools. Output was shotgun
12prary of cells was of reported sequences were immediately preceded
12prary of cells was of reported sequences were immediately preceded
12prary of cells was propression.

                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 treads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 treads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó:
                                                                                                                                                                               local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, numbblished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < la-34) to the EST and CDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
